Abstract of the Disclosure

The invention provides a lithium secondary cell including an inner electrode body impregnated with a non-aqueous electrolyte, formed from a positive electrode and a negative electrode, each formed from at least one metallic foil wound or laminated together and collectors to lead out a current from the inner electrode body. The edges of the metallic foil of the positive electrode and/or the negative electrode are arranged such that predetermined parts of the arranged metallic foils and predetermined parts of the positive electrode collector and/or negative electrode collector are joined together to lead out a current from the inner electrode body. The lithium secondary cell has excellent productivity and space-saving capabilities.
